ORDONNANCE

File upload is a quintessential component in every web/mobile application; it lets you upload files such as images, document files, etc., to the server or database. A file upload module becomes more relevant and user-friendly when a progress bar is attached to it; it helps to know about file uploading progress.

In this Laravel 8 progress bar tutorial, we will use Ajax to make an asynchronous HTTP request, and It primarily helps send and retrieve the data from a server. The good thing about AJAX is if you make any request, you don't have to refresh or reload the page, and it does all the work without halting the current process.
